Files Explorer is a feature-rich file manager for the Eclipse platform. It provides users with a graphical tree view, with all the operations necessary to browse and manage their files. However, the application is a light tool for managing large data sets. In the graphical view, users can browse the files in the current working directory, in other folders or subfolders. To reach one of these files, they just have to double-click the object in the tree view. For this reason, this type of application is perfect for file opening, extracting and installing purposes. Many of the tree views objects are of a standard type, like files, folders, packages, jars, projects, and so on. These objects can be accessed directly, or dragged and dropped into other views. For instance, the jar files are handled as any other Java packages, where one can add them as an entry, or remove them. This would be necessary to remove it from the project. The files management is done through some context menus, like open, extract, import, rename, update and compress. Users can also use the contextual menu for move, copy and delete. Listed under the utilities section are a handful of useful commands, such as zipinfo, expand and zipmv. This last command lets the user rename the file at any given moment, while it expands the archive. Another feature is the automated detecting of the content and updating the appropriate Eclipse views, so that the file is properly stored on the disk. The application also supports the creation of archives in various format, including the self-extracting and self-executing file formats. Java developers can use the aforementioned tools to clean up the project before doing an automatic build. CLONEWEBURL Description: CLONEWEB is a Java plug-in for JBoss which allows developers to clone projects from public cloud services, such as GitHub, Bitbucket and Jira. The tool is based on the technology of ECLIPSE webworks, and it's similar to Eclipse's Copy To, but with a web browser interface. In order to use this tool, the developers need to have ECLIPSE installed and be connected to the internet. The first step involves just creating a new project with this plug-in. This project can be either a work in progress or a standard Java EE application. After this, the developer has to log in to the cloud service of his choice, and select a project to clone. The project is available 1d6a3396d6
